JCOMM OBSERVATIONS COORDINATION GROUP
SEVENTH SESSION

Esporles, Mallorca, SPAIN
4-6 April 2016

FINAL REPORT

JCOMM Meeting Report No. 126
NOTES

WMO AND IOC DISCLAIMERS

WMO Regulation 42
Recommendations of working groups shall have no status within the Organization until they have been approved by the responsible constituent body. In the case of joint working groups the recommendations must be concurred with by the presidents of the constituent bodies concerned before being submitted to the designated constituent body.

WMO Regulation 43
In the case of a recommendation made by a working group between sessions of the responsible constituent body, either in a session of a working group or by correspondence, the president of the body may, as an exceptional measure, approve the recommendation on behalf of the constituent body when the matter is, in his opinion, urgent, and does not appear to imply new obligations for Members. He may then submit this recommendation for adoption by the Executive Council or to the President of the Organization for action in accordance with Regulation 9(5).

Annex III: Actions from OCG-7........................................................................ 13
Annex IV: Summary of progress against actions from OCG-6............................ 19
GENERAL SUMMARY OF THE WORK OF THE OCG-6 SESSION

The Seventh session of the JCOMM Observations Coordination Group was held at IMEDEA in Esporles, Majorca, at the kind invitation of the Mediterranean Institute for Advanced Studies (IMEDEA) and Balearic Islands Coastal Observing and Forecasting System (SOCIB). The meeting was held overlapping with the GCOS-GOOS-WCRP Ocean Observations Panel for Climate (OOPC).

1. ORGANIZATION OF THE SESSION

1.1. Opening of the Session

The seventh session of the JCOMM Observations Coordination Group (OCG) was opened by the co-chairperson of the Group, Dr David Legler (USA), at 0900 hours on the 4th April.

Dr Joaquin Tintore, Director of SOCIB, and representing IMEDEA and Ms Maria Jose Guerrero from the Spanish National Institute of Meteorology, (AEMET) welcomed the participants to the Session on behalf of the government of Spain.

On behalf of the Secretary-General of the WMO, Mr Petteri Talaas, and the Executive Secretary of the Intergovernmental Oceanographic Commission (IOC), Dr Vladimir Ryabinin, the WMO and IOC Secretariat representatives also welcomed the participants to the session, and to Esporles. The Spanish Government, and IMEDEA/SOCIB for organizing the OCG Session.

Dr Legler recalled the objectives of the OCG, and provided an overview of the OCG and of the goals for the meeting, which largely focused on the review of the OCG work plan targeting progress towards two major events during the next 5 years: JCOMM-V and Oceanobs’19. These activities will provide OCG opportunities to convey the value of observations to JCOMM and put forth an updated vision for JCOMM observations for the future. Of course JCOMM will require support and resources to support new activities in support of its vision. The overlapping session with OOPC focused on the development of network specifications, and particularly the network based actions to go into the GCOS Implementation Plan under development in 2016. The OCG work plan will capitalize on the strengths and synergies across the OCG networks with an eye towards activities that can be completed in advance of JCOMM V and Oceanobs’19. The updated Workplan is the main outcome of this meeting, and can be found in Annex IV. All reports and background documents to this meeting can be found at www.jcomm.info/ocg-7.

The list of participants in the meeting is provided in Annex II.

1.2. Adoption of the Agenda

The OCG adopted its agenda for the session based on the provisional agenda with some changes. The adopted agenda is reproduced in Annex I.

1.3. Working Arrangements

The meeting agreed its hours of work and other practical arrangements for the session. The Secretariat introduced the documentation.

1.4. JCOMM OCG Workplan

The JCOMM OCG Workplan formed the basis of the Agenda, with focussed discussions on how to progress activities capitalising on cross network synergies in the areas of Requirements, Implementation (focussed on activities of the networks, engaging new networks and GRAs), JCOMMOPS, Best Practices, Data Management and Integration. As JCOMM-5 is coming up in 2017, this was also a substantial focus of discussion.

Implementation: Reports from the networks, Other observing coordination activities

Each network provided a report to the OCG, which covered the following points:
Brief update on status and activities since OCG-6.
Progress towards OCG work plan objectives, actions,

These written reports can be found on the meeting website, www.jcomm.info/ocg-7. The presentations were focussed on the forward look, and issues for discussion at OCG. The co-chairs thanked the networks for their thorough reports. Issues were raised and discussed in the context of the work plan.

1.5. Joint day: JCOMM OCG and OOPC

The day focussed on the status and development of the Essential Ocean Variable (EOV) Specifications and Network Specifications, which are the building blocks of GOOS planning (the strategic mapping) and reporting through various avenues, including the GCOS Implementation Plan. The EOV and Network Specifications were drawn on to write the ocean section of the GCOS Implementation Plan, including articulating requirements for ECVs and ECV based actions (what we want to deliver) network specifications, particularly network missions and targets were used to develop network based actions. The joint day discussions fed directly into the OOPC meeting (see www.ioc-goos.org/oopc19). The GCOS Implementation Plan will be out for public review over the summer.

2. REVIEW OF THE OCG-7 ACTION ITEMS AND RECOMMENDATIONS

The participants reviewed and approved draft action items, noting that individual names need to be identified for each action, to devolve activity in the networks and ensure all the work does not fall on the network chairs. The actions are summarized at the end of the Work Plan (appendix III).

Next OCG Meeting.

The timing and location of the next OCG meeting requires further discussion.

3. CLOSURE OF THE SESSION

The Chair congratulated the Group for the meeting's achievements. They thanked the IMEDEA for hosting the Session, the participants of the meeting for their contributions to the outcome of this meeting, and the Secretariat for their support prior to and during the meeting. The WMO and IOC Secretariat representatives thanked the IMEDEA, the OCG Chair, and the participants of the meeting for their contributions to this Session and the activities of the JCOMM Observations Programme Area (OPA).
Monday 4th April 2016

Organization of the Session, Priorities

Opening and welcome (OCG Chair, Local Hosts, JCOMM co-president, Nadia)
Opening remarks will cover preparation of JCOMM-5, expectations of OCG, review focus, structure of JCOMM Programme Areas, and identification of deliverables to JCOMM-5

1.1 Adoption of the agenda
1.2 Working arrangements

Requirements (GCOS, GOOS, JCOMM Services)

GCOS Implementation Plan drafting process and status, role of EOV Specifications, Network Specifications requirements for inputs from OCG (Bernadette Sloyan, OOPC co-chair)
JCOMM services, priorities, emerging areas, requirements, products (Nick Ashton)
WMO Integrated Global Observing System (WIGOS), activities, priorities for engagement, and Rolling Review of Requirements (RRR) (Guimei Liu, Jon Turton).

Discussion:

2.1.1 Requirements changes since 2010
2.1.2 Change/refinement of network targets
2.1.3 Ready to move to EOV/ECV targets and how?

Implementation (development of network Specifications, clear missions and Targets)

Review progress by current networks: risk assessment, action items, metrics etc
Progress in establishing Glider Network (Pierre Testor)
IOCCP: Progress in developing network targets, performance metrics, activity relevant to OCG Work Plan; request for coordination help from JCOMMOPS
TPOS 2020: New requirements, technology, interim plan, transition-Implications for JCOMM (Katy/David)

4 Revisit JCOMM-V:

SWOT analysis of current JCOMM structure and activities,
OCG contributions, including proposed changes to organization (Nadia/David)

Tuesday 5th April

1. Review outstanding MAN-12 and OCG-6 Actions

Coastal networks engagement in JCOMM

6.1. GRAs, coordination of coastal observing networks, synergies with OCG work plan (Glenn Nolan)
6.2. IMEDEA/SOCIB Activities (Joaquim Tintore, Ananda Pascual)
6.3. HF Radar (Hugh Roarty)
6.4. Discussion: recommendations, actions to foster engagement with coastal networks and GRAs

Engagement of other observing networks

7.1. Revisit list of networks of potential interest with OCG
7.2. Review engagement strategy towards targeted networks/observing efforts
7.3. Possible actions for OCG

**JCOMMOPS and Network Metrics.**
8.1. Review progress on JCOMMOPS work plan, new website, metrics development (Mathieu Belbeoch)
8.2. Review of Network Metrics/Targets in Network Specifications
8.3. Feedbacks and discussions

**Best Practices (see draft Vice Chair TORs)**

Vision for OCG best practices (OCG co-chair, Albert)

**Data Management and Integration (see draft Vice Chair TORs)**

10.1. Data integration progress, connections to other activities (Steve Worley, Kevin O’Brien)
10.2. Links to JCOMMOPS (Kevin, Mathieu)
10.3. Product development (David Legler, Nick Ashton)
10.4. Connections to DMPA, TT-MOWIS (Steve Worley, David Legler?)
10.5. Open access to GTS project (David)
10.6. Way forward

**JCOMM-5 Revisited.**

11.1. Proposals for change: structure, emphasis, integration and process
11.2. Next steps to develop proposals for JCOMM-V
11.3. OCG governance – identifying additional co-chairs

12. **OCG-7 Wrap up**

**Wednesday 6th April Joint day of OCG and OOPC**

**J1: Observational Requirements**
J1.1 High level drivers for sustained ocean observations and context for the GCOS IP, GOOS (Albert, Mark Dowell)
J1.2 Draft GCOS IP Ocean Section Action Items (Bernadette)
J1.3 Discussions: consequences for EOVs/ECVs, requirements of networks, requirements of and need for network specification sheets

**J2: Network missions/targets**
J2.1 Review of Draft GCOS IP 2016 Action Items
J2.2 Emerging networks and technologies (OCG chair, Glenn Nolan)
J2.3 Progress in developing initial "no regrets" targets for biogeochemistry? (Maciej Telszewski)
J2.4 Develop methods/techniques to enable reporting against action items
J2.4.1 JCOMMOPS
J2.4.2 Data Management
J2.4.3 Metadata requirements
ANNEX II

LIST OF PARTICIPANTS

OCG Member

Dr. David LEGLER
Chief, Climate Observations
National Oceanic and Atmospheric Administration / Office of Oceanic and Atmospheric Research
Climate Program Office
1315 East West Highway

</thead>
<tbody>
<tr>
<td><strong>1. JCOMM-5</strong></td>
<td>JCOMM-5 Session, October 2017; Chairs will distill conversation, suggestions, and identify input to be provided to MAN-13.</td>
</tr>
<tr>
<td><strong>Leads</strong></td>
<td>Chairs</td>
</tr>
<tr>
<td><strong>Timeline/Deadline</strong></td>
<td>MAN-13 (Oct 2016)</td>
</tr>
<tr>
<td><strong>2. Requirements</strong></td>
<td></td>
</tr>
<tr>
<td><strong>1</strong></td>
<td>ACTION: Bob Weller to look at the Sensible and Latent Heat Fluxes EOV Specification: should this include radiative fluxes? (Shortwave/longwave). For discussion/agreement with Mark Bourassa</td>
</tr>
<tr>
<td><strong>Leads</strong></td>
<td>Bob Weller, Mark Bourassa</td>
</tr>
<tr>
<td><strong>Timeline/Deadline</strong></td>
<td>2nd May</td>
</tr>
<tr>
<td><strong>2</strong></td>
<td>ACTION Nick Ashton, Bob Weller, Jon Turton to look at Swail et al. document on requirements for Wave Observations. Draft suggestions to scope a possible Waves obs workshop to reconcile expressed wave requirements vs possible observations, and recommend OCG observing activities in OCG (proposal to be circulated for for discussion at upcoming Roundtable and presentation at JCOMM MAN, October 2016).</td>
</tr>
<tr>
<td><strong>Leads</strong></td>
<td>Nick Ashton, Bob Weller, Jon Turton, Val Swail</td>
</tr>
<tr>
<td><strong>Timeline/Deadline</strong></td>
<td>MAN-13</td>
</tr>
<tr>
<td><strong>3</strong></td>
<td>ACTION: RRR and EOV specifications should be as consistent as possible; and, communications between OCG/OOPC and RRR not ideal to encourage consistency. OOPC/OCG is updating requirements. RRR to be sent updated EOV specification sheets and asked to identify major differences for discussion by OOPC/OCG (Guimei Liu).</td>
</tr>
<tr>
<td><strong>Leads</strong></td>
<td>Guimei Liu</td>
</tr>
<tr>
<td><strong>Timeline/Deadline</strong></td>
<td>OOPC-20, OCG-8</td>
</tr>
<tr>
<td><strong>4</strong></td>
<td>RECOMMENDATION (OOPC/GOOS SC/OCG): Requirements setting and development activities need continued discussion to insure requirements reflect inputs from developmental projects such as. TPOS 2020, DOOS, OOPC planned BCs activity. Moreover, the requirements need constant attention and review by OOPC, OCG, WMO/RRR, etc. (Secretariats to encourage dialogue amongst groups, and further develop and document, improved transparent processes GOOS and OOPC and OCG are using regarding requirements)</td>
</tr>

<td>Recommendation: OOPC to engage GRAs re. Open Ocean-Shelf (Boundary Currents) evaluation activity</td>
<td>Bernadette Sloyan, John Wilkin to contact GRF Chair</td>
</tr>
<tr>
<td>28</td>
<td>Recommendation: OOPC to present Boundary Currents activities to GRAs (e.g. Webinar, through a GRA telecom, attendance at a GRF meeting? (action TBD for John))</td>
<td>John Wilkin, Tim Moltmann</td>
</tr>
</tbody>
</table>

### COASTAL: HF Radar

<table>
<thead>
<tr>
<th>Action</th>
<th>Description</th>
<th>Responsible Parties</th>
<th>Timeline</th>
</tr>
</thead>
<tbody>
<tr>
<td>29</td>
<td>ACTION: DBCP to consider whether the HF Radar should be considered as part of the DBCP Waves pilot project in part to address questions regarding validation of HF Radar wave information</td>
<td>Jon Turton</td>
<td>DBCP-32, October 2016</td>
</tr>
<tr>
<td>30</td>
<td>RECOMMENDATION: OCG Exec and GEO-HF Radar COP to explore potential for HF Radar to engage in OCG work plan (and related) activities such as:</td>
<td>OCG Chair, Hugh Roarty</td>
<td>OCG-8</td>
</tr>
<tr>
<td></td>
<td>· Standards and best practices (drawing on existing best practices experience and documentation, and potential for OCG to review/approve HF Radar guides)</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>· Calibration/ validation, and quality control by EOV (i.e. DBCP Waves: PP-WET) (see Action29)</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>· Engaging in the OOPC boundary current activity (action to be discussed with OOPC)</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>· Connection with Services Area (ETWCH/ETOOS) (action to be discussed with SFPA/Nick)</td>
<td></td>
<td></td>
</tr>
<tr>
<td>31</td>
<td>ACTION: GEO HF Radar COP and JCOMM OCG exec to consider whether JCOMM HF Radar to be proposed as a Joint JCOMM/GEO group.</td>
<td>OCG Chair, Hugh Roarty</td>
<td>OCG-8</td>
</tr>
<tr>
<td>32</td>
<td>ACTION: Review ocean applications section on HF radar in WMO Statement of Guidance</td>
<td>Guimei Liu, Hugh Roarty</td>
<td>OCG-8</td>
</tr>
</tbody>
</table>

7. Engaging new
33 **ACTION:** Initiate dialogue with animal tracking community to discuss potential for JCOMM OCG engagement.  
**Sam Simmons**  
**OCG-8**

34 **ACTION:** Consider invitation to the animal tracking community (sensor data collection) to discuss coordination activities, standards/best practices, data and QC, EEZ issues and other areas of potential intersection with OCG. (secretariat)  
**Secretariat**  
**OCG-8**

### 8. JCOMMOPS

35 **ACTION:** JCOMMOPS web tool needs an easier-to-find front page description/introduction to JCOMMOPS (JCOMMOPS)  
**JCOMMOPS**

36 **ACTION:** Develop and distribute a regular update on status of the JCOMM observing system by the start of 2017:  
**JCOMMOPS, Secretariat to solicit representatives from networks**  
**Update September Roundtable, January 2017**

- Identify a team from OCG to develop draft design/focus of the report (each network to nominate a representative; Secretariat to solicit for representatives)
- Secretariat to develop a proposed mailing list to IOC members and WMO JCOMM members

37 **RECOMMENDATION:** OCG Urges registration/adoption of Unique IDs for platforms and requests JCOMMOPS to work with networks to make a formal change request to JCOMM V (JCOMMOPS)  
**JCOMMOPS**

38 **ACTION:** Networks to decide whether they want network brochures in consultation with JCOMMOPS, and as appropriate, develop brochures for distribution.  
**JCOMMOPS**

39 **ACTION:** Advance development of Risk Assessment metrics. Secretariat to distribute latest draft of white paper to OCG exec for further revision  
**Secretariat**  
**Ahead of a JCOMMOPS Round Table**

40 **ACTION:** Start tracking progress by all OCG networks towards use of BUFR in reporting real-time data on the GTS (JCOMMOPS to solicit/compile info, and impediments including lack of appropriate template)  
**JCOMMOPS, Jon Turton**  
**Ongoing. Report to OCG-8**

41 **ACTION:** OCG Representatives to provide feedback on RMIC Proposal for a Framework of the Global Ocean Observations Standard System (including Guides for calibration seawater dissolved oxygen and nutrients).  
**Secretariat**  
**1st May**

42 **ACTION:** OCG to consider request for RMIC Coordination Committee and communicate decision to JCOMM-Man (during upcoming OCG call)  
**OCG Chair/Vice Chair**  
**Ahead of a JCOMMOPS Roundtable**

9. Priorities and timeline of activities ............................................................................................ 52
1. Introduction/Context.

The Joint WMO-IOC Technical Commission for Oceanography and Marine Meteorology (JCOMM) Observations Programme area is one of 3 JCOMM Programme Areas; the others are Services and Forecasting Systems, and the Data Management Programme Areas.

Figure 1. JCOMM Organisational structure

The Observations Coordination Group comprises representatives of the major networks involved in observing oceanography and marine meteorology. The OCG Work Plan is to identify areas where we can improve the technical coordination and implementation of the ocean observing system, and to capitalize on the strengths and synergies of the major observing networks. While there are core partners, OCG are keen to reach out to emerging networks, to build/capitalize on synergies across networks. A list of existing and emerging networks, with identified contact points, can be found in appendix 1.

While the observing networks have their own coordination mechanisms, there are many commonalities between networks and there are opportunities to further build on synergies; for instance, in reporting status metrics; deployment, logistics and ship time, sensor development and calibration, data flow, metadata standards, and quality control.

The aim of this document is to set the focus for OCG activities for the coming 5 years, under a core set of work areas where we can capitalize on the strengths and synergies across the networks. The work plan then provides a framework for the agenda of each OCG meeting, and the resulting actions, helping us to focus intersessional activity. By articulating the focus areas and coordination activities in this way, it also enables us to communicate OCG’s role to the broader community and to emerging networks who may want to engage in some of the OCG Work Plan activities.

The OCG works closely with the GCOS-GOOS-WCRP Ocean Observations Panel for Climate, which focusses on setting observation requirements and observing systems design. The OOPC also implements a 5-year Work Plan (currently 2013-2018), which focusses on:
• Evaluating requirements for observations of Essential Climate Variables and Essential Ocean variables (and reporting through GCOS and GOOS), and developing variable based observing system performance metrics.

• Working with JCOMM OCG on developing network targets in response to requirements for Variables, and assessing network performance.

• Running Systems based evaluations to ensure the observing system in particular domains collectively meets requirements.

The JCOMMOPS team are charged with the technical coordination of the individual networks, with the following Vision:

‘JCOMMOPS occupies a unique place as the focal point for the practical co-ordination of the in-situ ocean observing system defined by JCOMM. Its role consists of the following core objectives:

• to assist in the implementation and deployment of the observing networks through close interaction with programme managers and platform operators, and through Capacity Development and outreach;

• to assist in establishing, maintaining and verifying mechanisms for the timely exchange of data and metadata, including the facilitation of quality control and archival functions;

• to develop the consistent set of tools needed to monitor the status of the observing system and its attendant data and metadata distribution, so as to identify action areas and improve the overall effectiveness and development of the system.’

JCOMMOPS also has a Work Plan in development, which will be complementary to the JCOMM OCG Work Plan, focusing on providing technical support and implementation tracking for the networks, with an emphasis on leveraging, building on synergies and opportunities across the networks.

2. Key Horizons/Deadlines/Timelines

There are a number of programmes and activities to consider when planning OCG activities to ensure they have the most impact on influencing observing system development;

The Global Climate Observing System, which has a 5-7 year planning and reporting cycle (next Implementation Plan will be developed during 2016). This plan describes requirements for the observation of Essential Climate Variables, and identifies actions for the coming 5 years to meet these requirements (i.e. network Targets).

The Global Ocean Observing System, which is developing a Strategic Map of GOOS, a living document, highlighting the interconnectedness of the system, and delivery to key application areas (Climate through GCOS, Real Time Services through JCOMM and GODAE Ocean View, and Ocean Health. Areas of the document will be updated through finite lifetime ‘GOOS Development Projects’, such as the Tropical Pacific Observing System (TPOS 2020) Project, and The Deep Ocean Observing Strategy (DOOS).
Requirements also need to be communicated through the WMO Rolling Review of Requirements Process, to ensure gain the attention of Met Services.

Key deadlines are as follows:

2017: JCOMM-5 Session: opportunity to revisit JCOMM and OCG Organisational Structure and seek support for observational plans/targets. (see appendix 2 for targets for OCG from JCOMM-4).

2019: OceanObs19: Opportunity to revisit the performance of the observing system, and opportunities to better meet requirements. By Oceanobs19 OCG should have had all networks participate in at least one workshop that review/consider observing needs; and receive feedback on scientific and/or services requirements and how well networks meet (or could meet) those needs; and receive updated network targets

Update 2016

GCOS Implementation Plan

The GCOS Implementation plan has been drafted with key input from the JCOMM Observations coordination Group. Mostly through the Network Specification sheets, which includes the articulation of network missions and targets, which went on to inform the GCOS IP actions. The approach to the document was discussed at the OCG meeting, and the members will be invited to review the IP mid-2016.

JCOMM-V.

The focus of JCOMM-5 was discussed. As at each JCOMM session, groups are reformed and refocused, it is an opportunity to propose some organizational changes. The JCOMM President highlighted how the meeting would be focused, and what the co-Presidents hope to get out of the meeting. In particular, the OCG discussed the benefits of Cross programme area connections and the potential to strengthen them ahead of the next JCOMM MAN and in preparation for making recommendations on improved organization of JCOMM and the JCOMM-5 Session.

1. JCOMM-5 Session, October 2017; Chairs will distill conversation, suggestions, and identity input to be provided to MAN-13. Chairs MAN-13 (Oct 2016)

3. Requirements

To communicate and advocate for the development of the ocean observing system, requirements are developed through a number of fora to ensure that the range of stakeholders and implementers of ocean observations are engaged.

OCG primarily works with the GCOS-GOOS-WCRP Ocean Observations Panel for OOPC on setting requirements for observations. Requirements setting needs to be an iterative process which considers cost and feasibility of observations, verses their value or impact.

To enable us to communicate requirements for observations consistently through these fora, OOPC are leading the development Variable Specification Sheets are being developed to articulate the requirements for the observations of a Variable, its applications, and the processes/phenomena that need to be captured, and how the observations come together to meet these requirements. This articulation of requirements will also enable the articulation of observing system performance by variable.
OOPC has its own Work Plan (2013-2018), which is reviewed and updated every year. It focuses on setting requirements and assessing observing system performance by variable, and systems based evaluations of the observing system to guide the transition or expansion of the observing system.

2016 Update

OCG had direct engagement with OOPC through an overlapping meeting. This year, it was mostly focused on developing input for the GCOS Implementation Plan, including discussions on requirements for existing ECVs, proposed ECVs and network Targets. The proposed new ECVs are Ocean Surface Vector Stress, and Sensible and Latent Heat Fluxes (note, this was later changed to Ocean Surface Heat Fluxes).

The Boundary Currents workshop is planned for 2017, and OCG members are encouraged to engage.

1 ACTION: Bob Weller to look at the Sensible and Latent Heat Fluxes EOV Specification: should this include radiative fluxes? (Shortwave/longwave). For discussion/agreement with Mark Bourassa

2 RECOMMENDATION (OOPC/GOOS SC/OCG): Requirements setting and development activities need continued discussion to ensure requirements reflect inputs from developmental projects such as TPOS 2020, DOOS, OOPC planned BCs activity. Moreover, the requirements need constant attention and review by OOPC, OCG, WMO/RRR, etc. (Secretariats to encourage dialogue amongst groups, and further develop and document, improved transparent processes GOOS and OOPC and OCG are using regarding requirements)

3.2 Engaging with JCOMM Services

2016 Update:

Nick Ashton presented on Services Programme Area activities, and the need and opportunities to better connect up the 3 programme areas. OCG discussed the potential for identifying exemplar activities which connect up observations, data management and services delivery, including the potential for the chairs of the programme areas to discuss opportunities with the co-presidents in the run up to JCOMM-5.

Wave observations were highlighted as an area where some effort by OCG was needed to capitalise on developments in observing platforms and technologies, to better deliver to services requirements, building on a task team which sits within DBCP (Wave Measurement Evaluation and Testing). A small subgroup was identified to scope how to take such an activity forward.

Other examples of cross programme area connections will be discussed with the co-presidents in the run up to the JCOMM V session.

2 ACTION Nick Ashton, Bob Weller, Jon Turton to look at Swail et al. document on requirements for Wave Observations. Draft suggestions to scope a possible Waves obs workshop to reconcile expressed wave requirements vs possible observations, and recommend OCG observing activities in OCG (proposal to be circulated for discussion at upcoming Roundtable and presentation at JCOMM MAN, October 2016).[KH1]
3.3 Engage with other ocean and cryosphere observation groups

JCOMM OCG is responsible for the technical coordination of ocean observing networks, capitalizing on cross-network synergies. Hence, OCG needs to coordinate with and respond to other groups who are charged with setting requirements for ocean observations, including the Global Climate Observing System (GCOS) and the Global Ocean Observing System (GOOS) through the Ocean Observations Panel for Climate (OOPC), and connect to other global and regional efforts including:

- the Partnership for Observation of the Global Ocean (POGO) which focusses on coordinating and leveraging the observing activities of the major oceanographic institutions,
- the ICSU Scientific Committee for Oceanic Research (SCOR) who establish expert groups for the development of best practices.
- the ICSU Scientific Committee for Antarctic Research (SCAR) who along with SCOR, have sponsored the Southern Ocean Observing System (SOOS).

2016 Update.

Discussions re, partnerships focused on the potential for networks (particularly GO-SHIP) to partner with POGO for capacity building initiatives, and expanding the number of agencies who are able to engage in POGO (see section 4).

3.4 WMO and the WMO Integrated Global Observing System (WIGOS)

WIGOS is a programme to bring the existing WMO observing systems (that have developed separately) under a consistent framework to improve efficiency and coordination, as such it is a ‘system of systems’. An important aspect for JCOMM will be the interfaces between WIGOS and non-WMO observing systems (such as Argo and OceanSITES).

The implementation of the WMO Integrated Global Observing System (WIGOS) framework is focusing on 10 Key Activity Areas (KAAs), in which JCOMM has a role to play, as noted below:

1. Management of WIGOS implementation
2. Collaboration with the WMO co-sponsored observing systems & international partner organizations & programmes
3. Design, planning & optimized evolution
4. Observing System operation & maintenance
5. Quality management
6. Standardization, system interoperability & data compatibility
7. WIGOS Operational Information Resource (WIR) (including OSCAR the Observing System Capabilities Analysis and Review Tool)
8. Data & metadata management, delivery & archival
9. Capacity Development (including development of RMICs, Regional Marine Instrumentation Centres)

10. Communications & outreach

The WIGOS pre-operational phase priorities for the period 2016-2019 are:

1. National WIGOS Implementation
2. Regional WIGOS Centres
3. WIGOS Information Resource - OSCAR
4. WIGOS Data Quality Monitoring System
5. WIGOS Regulatory and Guidance material

For WIGOS implementation each country (WMO Member) should have a designated national WIGOS focal point who should be the contact point for other national observing networks that can/wish to exchange data. WIGOS numbers will provide a unique reference to each individual station/platform, including national/other networks that have their own numbering system. For exchange of data. For data exchange the WMO Information System (WIS), that includes GTS, is the telecommunications infrastructure used by WIGOS. However, data can only be exchanged on the GTS in agreed WMO formats, where Table Driven Codes such as BUFR and GRIB will replace the legacy Traditional Alphanumeric Codes that are being phased out. BUFR provides an opportunity to overcome the limitations of the old TAC (e.g. low precision, only physical variables, no quality flags) and to develop templates for new platforms (e.g. autonomous surface vehicles) that better map to the platform’s capabilities. BUFR templates presently exist for VOS data, moored buoys, drifters, Argo floats, XBT data, ship-based CTD profiles, thermosalinograph data, sub-surface gliders.

Within two JCOMM Regional WIGOS centres have been established at NMDIS, Tianjin, China and NDBC, Gulfport, US.

OSCAR (http://www.wmo-sat.info/oscar/) is a database developed to allow the performance of critical reviews by comparing observing system capabilities with technology-free user requirements, it has three components: OSCAR/Requirements (well established), OSCAR/Space (well established) and OSCAR/Surface (still under development). OSCAR/Requirements supports the WMO RRR process, with 12 application areas defined each with a designated point of contact: where Guimei Liu is the contact for Ocean Applications. OSCAR/Surface will enable a step change in metadata access for surface based (and sub-surface) observing systems. However, a key challenge will be to populate OSCAR/Surface with all the mandatory metadata. For marine/ocean networks we define metadata specific to the networks and platform types; this will be collected through JCOMMOPS who will then submit the required metadata to OSCAR, which will be the ‘official’ repository of WIGOS metadata. Having all the metadata in one place will allow for a more complete analyses of our overall observational capability, however many data users will still require the more extensive metadata held by JCOMMOPS (and/or network GDACS).

Data quality monitoring – for ‘traditional’ surface marine data from VOS and buoys, near real-time comparison are made against NWP background fields. The UK Met Office is a WMO lead centre for monitoring the quality of surface marine observations at UK Met Office (with monthly reports) and Meteo-France provide the EUMETNET QC tools and monitoring statistics. However, for oceanographic data, the data are used to validate the models rather than the models to validate the data. For T&S profiles well specified real-time and delayed-mode QC systems are in place and oxygen is emerging, but QC of other bio-geochemical variables (chlorophyll, nitrate etc.) is still an area of active development.
In terms of WIGOS Regulatory and Guidance material: Technical Regulations impose definite requirements and strong recommendations upon Members, using the words ‘shall’ and ‘should’ to express these precise meanings; Manuals describe detailed technical specifications, using the same language as above, and are considered to be ‘dynamic’ annexes to the Technical Regulations, with the same regulatory significance, whilst Guides typically offer implementation guidance, case studies, advice on best practice and the like, and carry no regulatory weight, even if the words ‘shall’ and ‘should’ are used.

OCG has appointed Jon Turton as a vice chair for managing the connection to WMO/WIGOS and the Rolling Review of Requirements, and to help manage and prioritise engagement with WMO activities.

3 **ACTION:** RRR and EOV specifications should be as consistent as possible; and, communications between OCG/OOPC and RRR is not ideal to encourage consistency. OOPC/OCG is updating requirements. RRR to be sent updated EOV specification sheets and asked to identify major differences for discussion by OOPC/OCG (Guimei Liu).

4. **Observing System Implementation**

4.1 **Development of Network Specifications and Targets.**

To advocate for support for ocean observations, clear Network targets need to be developed and communicated through GCOS, GOOS, JCOMM and WMO Rolling Review of Requirements. Clear targets are also needed to enable us to articulate the status and performance of the observing system (see further details in section 5).

OCG will work with OOPC to develop Network Specification sheets to articulate the role of components of the observing system, highlight interdependencies, and set targets for implementation, and track implementation.

**2016 Update:**

Reports from networks are provided for each meeting, and feedback is provided by the OCG (reports available at www.jcomm.info/ocg7. In addition, the networks are working on a consistent set of Network Specifications. A full set of Network Specifications will be available by the end of 2016. This year, the OCG particularly acknowledged the efforts of GLOSS in taking feedback from OCG-6 onboard, and progressing activities to clarify missions, targets and data availability.

Two key activities have been identified where we can approve coordination across OCG: The use of volunteer observing ships and ships of opportunity; and the engagement between IOCCP and the observing networks.

Many of the networks utilize ships either for taking observations (Volunteer Observing Ship Network, SOOP XBT, CO2, CPR), or deploying equipment (such as drifters and Argo). Each network has their own approach to engaging with shipping companies, and often this engagement is led at a principle investigator/individual level. As the ability to take autonomous observation from underway vessels from ships, as does the desire for groups to engage with the shipping industry. Therefore, it was decided that an assessment of underway observation and deployment activities (existing and planned should be carried out, including existing/proposed engagement with the shipping industry, with a view towards improved coordination across the networks and a consistent approach to engaging the shipping industry. Further discussions also needed regarding how expanded underway observing activities be coordinated and marketed.
IOCCP has been represented at OCG meetings for a number of years, and there is movement towards a more organic connection between IOCCP and the other OCG panels, as the measurements being coordinated through IOCCP are generally combined with other network activities (e.g. GO-SHIP, OceanSITES, Argo), or would benefit from greater coordination with established groups (i.e. Ship observations team with SOOP CO2). Initially, it was decided that the SOOP CO2 programme participates in the Ship Observations Team –Ships of Opportunity Programme, and also works with JCOMMOPS to bring their observation information into the JCOMMOPS web tool.

### 4.2. Specific Network activities.

Each network provided a report to the OCG, which covered the following points:

4. Brief update on status and activities since OCG-6.
5. Progress towards OCG work plan objectives, actions,

#### 4.2.1. Argo

Currently the Argo Array is looking very healthy, though there is concern that some key investment lines are not keeping pace with ongoing costs, and/or be in decline (e.g., US, Australia, Japan). Efforts internationally focused on lifting performance of the array across the board, drawing on the experience of the higher performing implementation groups. However, there are concerns about the array given future investment trajectories.

The programme also is continuously reviewing the design of the array in response to requirement, and to address gaps. Ensuring global completeness is highlighted as the first priority; to deliver a spatially complete 3x3 degree array, including marginal seas and the seasonal ice zone, around 3800 floats are needed. Increasing densities in Equator, boundary regions are currently being trialed, but there aren’t rigorously tested requirements at this stage. Improved performance metrics are under development in consultation with JCOMMOPS, focused on number of floats, plus float coverage, in order to better track and communicate the array status.

In addition, testing and development activities are underway; Deep Argo floats are undergoing platform testing and pilot testing. Regional pilots are underway, and the community is working towards a global design. Bio-geochemical (BGC) Argo floats are being tested through numerous deployments: sensor and metadata specifications are complete. A report from a recent Bio-Argo workshop should further crystallize plans for a global array.

Argo sought advice on the process for reviewing proposed design evolution. OCG advised that OOPC has responsibility for reviewing observing system design, and recommended Argo engage proactively in relevant reviews and design projects such as TPOS 2020, DOOS, and the OOPC planned Boundary currents activity.

The challenge of skyrocketing complexity of data streams due to novel float payloads is having an impact on delivery of core delayed mode data. Argo needs to balance welcoming new data with maintaining core array performance. Options under consideration include excluding complex payload floats from Argo GDACs, versus keeping all data at the GDACs, noting that novel data would not be in the required Argo netCDF format or QC’d. These options need further discussion in the community.

Argo requests that all Argo float deployments should be connected to national Argo programmes, and welcomed efforts in OCG to share the burden across networks in defining metadata standards, parameters and conventions; as other networks such as OceanSITES and GO-SHIP also have to deal with a broad range of parameters. This will be progressed, in part, through the OCG Standards and best Practices activity.
BGC-Argo are working on 50-100 float deployments to test feasibility, and working on data standards. The delayed mode QC requires at least 1 year of data. Sensor technology is still very volatile. There is discussion whether to make a distinction between Bio-Argo and BGC-Argo. Many biogeochemical floats fit into the Argo mission relatively well, whereas some (Bio-Argo) floats fit less well and have different mission design, including profiling frequency and park depth, to time with diurnal cycle.

4.2.2. Data Buoy Cooperation Panel (DBCP)

The global drifter array has recovered in terms of the number of operating drifters following the rectification of manufacturing issues which reduced the drifter lifetimes. New targets and metrics have been agreed, including metrics for global coverage, data delivery, annual deployments, network age and half-life. Issues which are currently being addressed include technology development to improve reliability/cost effectiveness, efforts to increase drogue lifetime. Development activities include evaluating higher resolution SST measurements for satellite cal/val, and the development of wave measurement capabilities.

The national/coastal moored buoy network, is basically a ‘network of networks’ operated by over 15 countries for national requirements. Hence there is a wide variation in buoy designs and capability. Core measurements are the standard surface metocean variables, although some also include wave spectra and sub surface observations on the mooring line. Moored buoy targets are under discussion and would include % operating moored buoys and data delivery metrics. For Arctic/Antarctic Buoys and the Global Tsunami buoy network, similar metrics have been proposed and will be reviewed by relevant DBCP Action Groups. Metrics for the global tropical moored buoy network would be addressed by OceanSITES.

Challenges for DBCP moored buoys include securing ship time for maintenance, vandalism, inclusion of wave measurement, and metadata collection/organization. Currently, DBCP does not have complete metadata for the metocean moored buoys, and it is not possible to get a picture of what is being measured across the networks. A focused effort by JCOMMOPS will be needed to establish a metadata directory, and ongoing effort to keep it up to date, this will require resources.

Migration to BUFR format for exchange of data on the WMO GTS is underway. OCG requested regular updates on progress of this migration from all relevant panels and networks. Various DBCP members are also evaluating the potential for unmanned surface vehicles to be used for metocean data collection.
4.2.3. OceanSITES

The OceanSITES mission was outlined as: ‘... to collect, deliver and promote the use of high-quality data from long-term, high-frequency observations at fixed locations in the open ocean. OceanSITES typically aim to collect multidisciplinary data worldwide from the full-depth water column as well as the overlying atmosphere.’

The rational for OceanSITES is that time series observations at critical or representative locations are one essential element of a global ocean observing system to complement a range of other approaches. They can provide a unique view of the full temporal behavior of a system; accurate reference and long-time baseline data; and the maximum possible range of interlinked variables from the seafloor to the atmosphere while enabling shared resources.

While most sites are moorings, some are also ship based time-series. They include: Fluxes Sites, Multidisciplinary timeseries, Tropical Moored Arrays and Transport Arrays. A recent highlight is the progress made in establishing sites in the Southern Ocean: the Southern Ocean Timeseries (SOTS, Australia) and the Ocean Observatories Initiative (OOI) south of Chile.

Following recommendations from OCG, OceanSITES are working on performance metrics. However, this requires further discussion. OceanSITES are considering having inter-disciplinary task teams to focus on the development of targets, design best practice etc. However, OceanSITES is an umbrella for a number of individual programmes and P.I’s and the specific designs of sites is very heterogeneous, so this is the start of a conversation.

OceanSITES have started by focusing on defining the mission and targets for Fluxes sites. They are seeking help on requirements from the community. In parallel, they are working on standardizing OceanSITES metadata to be able to characterize what is being measured and where in the existing array.

During the discussion, the availability of OceanSITES data was discussed. Data from several OceanSITES surface moorings are being withheld from GTS to allow the OceanSITES data to be use as unique validation data. However, it was pointed out that if not on GTS then operational centres can’t access the data for model validation. Assimilating or withholding data (for validation) is a decision made by each individual forecasting centre. This strategy needs clarifying in consultation with GSOP, to ensure OceanSITES have optimum operational impact.

The OceanSITES group requested that it not considered part of DBCP, but continue as a community of practice. It was agreed that OceanSITES can continue as a programme/community of practice under the JCOMM OPA rather than an Action Group under but should connect to DBCP on areas of common interest. OceanSITES is a time-series was encouraged to moved forward with articulation of fitness for purpose. This will allow the community to better assess fitness for purpose.

### 4.2.4. Global Sea Level Observing System (GLOSS)

The evolution of the GLOSS programme has brought about confusion regarding the different aims, activities, and information/data portals of GLOSS. This includes the distinction between datasets and data streams, and interpreting the different network status maps. This was discussed in detail at OCG-6 and in follow up calls. The programme also has multiple web presences due to their connection to multiple data centres. This is currently being addressed, and GLOSS are working with JCOMMOPS to bring GLOSS metadata into the JCOMMOPS platform.

GLOSS is moving towards clarification of missions and targets, though this is a complex task requiring agreement from the team of GLOSS experts. GLOSS requirements were initially focused on climate (tracking El Nino, not sea level rise!) and now many stations are tsunami warning, extreme events, regional ocean processes, sea level rise and sea level acceleration. Each of these processes (or phenomena) have somewhat different requirements, and the tide gauge stations often operate on different time scales, latency, and levels of quality control (where latency and quality are inversely related).

Therefore, GLOSS proposes moving away from defining data streams in terms of fast delivery or delayed mode, and to focus on frequency/quality of the data. Data will be described as hourly, daily or monthly delivery, and flagged by level of quality control.

Missions/requirements are currently being defined, including design targets and delivery requirements, e.g. for altimeter calibration and validation, tsunamis and extreme events, regional variability, long term change. The OCG congratulated GLOSS on the efforts to respond to recommendations made at the last OCG meeting, and were encouraged by the progress made in a short space of time.

4.2.5. Global Ocean Shipboard Hydrography Investigations Programme (GO-SHIP)

The Go-SHIP Programme has defined its mission as a global repeated survey of 61 lines every 7-8 years. In addition, the programme has defined a ‘GO-SHIP associated’ class of cruises which conform to a broader (though still stringent) definition.

For the 2012-2023 decadal survey: Near 90% of lines are planned, committed or implemented. GO-SHIP has also had success in bringing on board new partners. Notably Ireland in following a meeting in Galway. There are however still challenges in securing commitments in the Indian Ocean and North Pacific. The GO-SHIP programme has made efforts to engage in the Indian Ocean Expedition II, but have had limited progress in ensuring GO-SHIP lines will be included.

The challenges of sustaining GO-SHIP were discussed, given broader concerns about resourcing and ship infrastructure. GO-SHIP’s strategy is focused on bringing onboard new nations, and this was the rational for defining GO-SHIP associated routes; as a platform for engagement. The Korean and Indian organisations are showing potential to step up more. In addition, GO-SHIP is encouraging multinational collaborations to occupy lines. The Ship Coordinator is helping to facilitate these. GO-SHIP were encouraged by OCG to work with POGO’s capacity building programmes.

The value of GO-SHIP in the context of other networks was discussed also, for instance, it was discussed whether OceanSITES timeseries should be established where two GO-SHIP lines cross. In addition, the value of deploying BioArgo floats on GO-SHIP lines to enable the calibration and validation of float data was discussed.

GO-SHIP:

15 RECOMMENDATION: OCG encourages activities to broaden capacity development in support of GO-SHIP, including multinational collaborations for occupying GO-SHIP lines and training activities, leveraging and coordinating with similar programs like POGO.

4.2.6. Ship Observations Team (SOT), including Voluntary Observing Ships (VOS) and Ships of Opportunity Programme (SOOP)

The VOS programme have been also working on developing targets, though has found this challenging as the main aim is to get as many observations as possible. Currently have 2000 vessels operating, and 40% delivering data in BUFR format. However, 90% of observations are coming from just 7 nations.

Progress is being made in tracking metadata; the Pub47 database (ship call signs and metadata) is being transitioned to JCOMMOPS. Historically, JCOMMOPS had trouble obtaining XBT metadata, but this is now being addressed through improvements in launching technologies and improved real-time data communications.
Given the expansion of the number of organisations and P.I.’s and types of observations being taken (or could be taken) on commercial vessels, discussions are underway within SOT to improve the coordination and promotion of activities utilizing commercial ships; this includes:

- Branding: SOOP/VOS activities would benefit from being promoted in a complimentary way under a single banner.

- Coordination of engagement with ships and shipping companies (both contact with shipping companies and on-ship activities). Currently, it is common to have multiple communities and observing groups approaching ship operators and captains. SOOP/VOS/JCOMMOPS feels this could be better coordinated to improve relationships and recruitment. This discussion should be expanded to include networks using commercial ships for deployments.

The OCG recommended the development of an engagement strategy for commercial ships that describes plans for uses of such ships across all of OCG networks and how such a program should coordinate interaction with ships while in port.

Chris Marshall,  
Report to OCG-8, SOT (April 2017)  
**4.3. Broader engagement with projects and programmes**

**4.3.1. International Ocean Carbon Coordination Project (IOCCP)**

The IOCCP presented an update on the various ocean carbon related observing activities. The need to broaden the connections between IOCCP and the OCG was emphasized, as most of the observations are carried out on existing platforms and networks: hence, continued and further coordination is needed between IOCCP components and individual networks. In line with OCG activities, IOCCP are working on a Network Specification for SOOP-CO2, and initiated a request that SOOP-pCO2 become part of the Ship Observations Team, and capitalizing on the activities to improve coordination across commercial ship based activities, and associated JCOMMOPS network tracking. This was considered a positive move by OCG, and IOCCP and SOT were encouraged to discuss SOOP-CO2 could be incorporated into SOT activities.

JCOMMOPS Round Table (May 2016)  

4.3.2. TPOS 2020

The Tropical Pacific Observing System 2020 project is developing recommendations which need to be taken up by both the sustained observing community and the research community. A phased reporting process has been established with an Interim plan being released in 2016, which will enable the observing networks to consider the trajectory of the project and its recommendations. In parallel to the release of the interim plan, a transition process for considering and implementing recommended changes to the observing networks will be developed and submitted to the OCG for review. OCG members are encouraged to review the interim plan (available during mid 2016), and also engage in discussions regarding transitioning the observing system.

TPOS 2020

24 ACTION: OCG members to be kept informed regarding potential role of JCOMM OCG in TPOS 2020 transition activities, including any possible Transition Team task team.

4.4. Horizon scan for emerging platforms, sensors, technologies and methodologies

OCG needs to proactively engage with groups testing emerging platforms that will in due course become part of the composite observing system, and seek to establish pilot activities to help evaluate and transition them to the sustained observations arena when ready.

Under the umbrella of Everyones Glider Observatory (EGO), progress has been made in implementing OceanObs19 recommendations. Since the last OCG meeting, the terms of reference and membership for an international Gliders Steering Team have been agreed, and a Data Management Team has also been agreed. The OCG congratulated the chair on his efforts in pushing forward the development of the International Glider Steering Team and encouraged the group to move forward with scheduling a first face to face meeting of the steering team, which is proposed for September 2016 in association with the EGO conference, and focus on developing a forward work plan.

The Glider Steering Team requested feedback on how best to move towards a global glider network design, including core observations (or tiers of observations). The OCG recommended engaging with the expert panels of GOOS, and in particular in upcoming evaluation activities such as OOPC’s Boundary Current-Shelf Interactions activity.

OCG will continue to engage new groups into OCG as they move towards global coordination, and where there is mutual benefit to their engagement. Ahead of the next meeting, discussions with the Animal Tagging community will commence (focusing on those tags which also take physical ocean
data). OCG will also keep track of progress in the use and coordination of autonomous/unmanned vehicles and assess whether to engage key groups in the future.

| Gliders |
|-----------------|-----------------|
| 18 Recommendation: OCG very pleased with progress made by Glider group. The glider group to rename their group in response to concerns regarding current acronym. | Pierre Testor OCG-8 |
| 19 ACTION: Distribute draft glider group TOR and membership to OCG for feedback and approval (OCG secretariat, complete by JCOMMOPS RoundTable call in May) | Secretariat JCOMMOPS Round Table May 2016 |
| 20 ACTION: OCG to consider and provide feedback on draft proposal for a global array of gliders to observe Boundary Current regions. The proposal includes network specification re. role of Gliders in Global Sustained Observing System (as input to OOPC Boundary Currents activity). | OCG Members June 2016 (ahead of Glider meeting in September 2016) |

4.4.2. Animal Tagging with physical sensors.

OCG will continue to engage new groups into OCG as they move towards global coordination, and where there is mutual benefit to their engagement. Ahead of the next meeting, discussions with the Animal Tagging community will commence (focusing on those tags which also take physical ocean data). OCG will also keep track of progress in the use and coordination of autonomous/unmanned vehicles and assess whether to engage key groups in the future.

| Animal Tagging |
|-----------------|-----------------|
| 33 ACTION: Initiate dialogue with animal tracking community to discuss potential for JCOMM OCG engagement. | Sam Simmons OCG-8 |
| 34 ACTION: Consider invitation to the animal tracking community (sensor data collection) to discuss coordination activities, standards/best practices, data and QC, EEZ issues and other areas of potential intersection with OCG. (secretariat) | Secretariat OCG-8 |

4.5. Continue to participate in new initiatives to expand ocean observing capabilities,

Where projects arise which will expand ocean observing capabilities, including lowering the cost per observation, addressing gaps, or improving integration, it was agreed that OCG should engage and encourage their development in the context of sustained observing, including the development of targets, and data and information management protocols. One example identified is the joint ITU/WMO/IOC initiative to use sub-sea communications cables for ocean observation and tsunami warning, and the increased activity in coastal regions.

2016 Update.
OGC is also initiating conversations regarding its engagement with the coastal observing community, and how to take the relationship forward for mutual benefit of both OCG and coastal observing activities. The GOOS Regional Alliances are increasing activities to connect up GRA work and capitalize on synergies in terms of the measurement of common EOVs, and use of common networks. They identified 3 major observing platforms which are used across many of the GRAs. Gliders (with whom OCG has already engaged), HF Radar, and Animal tagging. The need to connect up open ocean and coastal observations was particularly highlighted. Open ocean observations are well coordinated, and many groups are taking very coastal observations, but there is a gap in terms of connecting up the observations across the shelf in many cases.

The HF Radar community (coordinated through a GEO Community of Practice) has been encouraged to engage proactively in OCG activities, and in particular articulating how HF Radar fits into the broader sustained observing activities and product development for surface currents and sea state/waves. The discussion flowed through to the OOPC meeting which followed, particularly encouraging the HF Radar community to engage in the upcoming OOPC Evaluation activity on boundary currents and their interaction with the shelf.

</table>
5. **Observing System Metrics**

5.1. **Assessing and reporting Observing System Performance by Variable and Network.**

Observing system metrics are needed for a range of reasons, including:

- To articulate the value/impact of ocean observations and advocate for national investment
- To articulate observing system performance against requirements (by variable), and hence areas requiring strengthening/enhancements.
- For programme managers to advocate for and prioritise ongoing investment in sustained observation
- For the day to day operations of observing networks, including managing deployments.
- To track delivery of observations including data quality, data delivery, etc.
- To track uptake and use of the observing system (linked to articulating the value/impact).

The current observing system % complete diagram has been extremely valuable in advocating to build the observing system, but is not sufficient to advocate for sustaining, expanding and strengthening it going forward.

Hence, we need to develop metrics that fall into a number of categories:

- **Observing System performance by variable, such as:**
  - How well does the observing system meet requirements for x variable (i.e. capturing space/time/accuracy requirements, improving uncertainties).
  - What is the impact/value of each network against specific requirements?

- **Observing System Performance by Network, such as:**
  - Annual Level of effort metrics (Required deployments/occupations verses committed)
  - Coverage verses target.
  - Real time/delayed mode data delivery (% of total).

- **Risks to sustainability and Mitigation approaches such as:**
  - Technological Risks (reliance on single sensors)
  - Operational Risks (reliance on ship time, communications systems)
  - Funding risks (reliance on short term funding, small number of funders)

- **Uptake/Impact metrics:**
  - Journal Papers
  - Projects, students,
  - Take up by Products, models, etc.

While this list is long, their development will be prioritized based on utility, and the Variable and Network Specifications will be used as a basis for metrics. OOPC and OSMC will lead on the variable based metrics, and OCG and JCOMMOPS on the network based metrics.

2016 Update.

Progress has been made with networks on developing priority metrics to track progress and performance. These have been built into the new JCOMMOPS web tool, which is a sophisticated and comprehensive tool for tracking the status and performance of observing systems on demand. The tool is currently being tested and iterated with the networks and broader user community.
5.2. Developing a framework for identifying and mitigating risks.

Following recent experience with downturns in data availability from TAO and the Drifter Array, it is agreed that we need to be more pro-active in identifying risks to the sustained observing system, and approaches to mitigating them. In particular, we need to identify where a systems wide risk management framework would be beneficial.

**2016 Update.**

An intitial draft risk assessment report was developed by the secretariat, prioritizing the risk types across the OCG, and potential for cross-OCG mitigation strategies. The OCG Executive will discuss how to take forward this activity intersessionally.

**5.2. Developing a framework for identifying and mitigating risks.**

Following recent experience with downturns in data availability from TAO and the Drifter Array, it is agreed that we need to be more pro-active in identifying risks to the sustained observing system, and approaches to mitigating them. In particular, we need to identify where a systems wide risk management framework would be beneficial.

**2016 Update.**

An intitial draft risk assessment report was developed by the secretariat, prioritizing the risk types across the OCG, and potential for cross-OCG mitigation strategies. The OCG Executive will discuss how to take forward this activity intersessionally.
6. Best Practices

A Key priority of OCG is to promote the creation and timely updating of JCOMM best practice documentation. Many of the networks have a focus on the development of best practices for their network (i.e. Argo, GO-SHIP), however, driven by the need to be able to deliver ocean observations by variable, there is a need to be able to characterize and quantify the observational approaches and uncertainties across the networks, and there are also opportunities to capitalize on the best practice efforts of the individual networks to the benefit of the broader observing system. Therefore, many of the actions in this area are focused on the development and sharing of network best practice activities, and the coordination of best practice development and intercomparison activities by variable.

2016 Update:

The terms of reference for a Vice Chair to oversee the Standards and Best Practices area have been agreed by the executive, and OCG are now seeking nominations to fill this role. In addition, China RMIC presented on their proposed activities; the main recommendation from OCG was that these need to be better plugged into existing community level international coordination activities.

7. Data and Information

A strong focus on data and information management is essential if the full value of investment in sustained observations is to be realized. While JCOMM has a Data Management Programme area, and we also need to be cognizant of the activities of the Intergovernmental Ocean Data Exchange (IODE), the majority of global observing networks have developed their own data management and delivery activities and while some are working well, for some networks/observation types data management needs to be strengthened; More importantly, we need to leverage what is working well and better integrate our data management and delivery across the ocean observing networks to deliver observations by variable, to the best (and known) quality, in a form which is fit for purpose for key applications.

7.1. Promote the adoption of consistent standards and practices for data management

Strengthened activity is needed amongst the observing networks to facilitate discoverability and accessibility of integrated data for the research, forecast, and end-user communities as well as for product development. The Keeley Report, which includes a chapter on each network and also each variable, is a good starting point, but we need to develop a forward strategy and work programme building on this report.

By improving consistent standards and best practices, we are able to strengthen integration across the observing system, through activities such as NOAA OSMC’s ERDDAP data integration project. At the JCOMM OCG meeting, NOAA OSMC presented the results/benefits of ERDDAP, and it was enthusiastically received by the Network representatives. It was recommended that the ERDDAP project be presented at a number of ocean observing fora in the coming year to answer queries and questions from the community.

The main aim is to ensure we can compare datasets from different observing system in a consistent way, and move towards delivering datasets by variable of best quality.

Update 2016:

In the past year, OCG has mainly focused on the development of data integration approaches through the use of ERDDAP, and demonstrating their utility to the observing community. This needs to be taken to the next level through active engagement of network representatives in planning some pilot activities (perhaps focused on one or two EOVs, or a region/application), including identifying metrics for success. The DMPA needs to be engaged on these activities, which may help to bridge the activities of the two programme areas.

</tbody>
</table>
7.2. Continue to guide WMO through the mindset change that will allow them to be comfortable with data submitted by 3rd party organizations,

The Global Telecommunications System, GTS, is the communication system of choice for Real time data, and is particularly used by operational forecast centers to initialize models (including ocean forecasting and seasonal forecasting). However, the GTS system, coordinated through WMO, is coordinated through Meteorological and Hydrological Services, and while much of the ocean data sent to the GTS is collected by non-NHMS’s; and while they provide data onto the GTS, they are not able to access it to even verify what is delivered. Planning is underway for the success to the GTS, The WMO information System (WIS).

A JCOMM Cross Cutting Task Team for Meteorological and Oceanographic Services within WIS (TT MOWIS) is being established, and there may be some potential to engage TT MOWIS on this issue.

JCOMM OCG is working with WMO to develop a system that will allow such ‘3rd party’ organizations to have access to the WIS/GTS data for verification purposes.

Update 2016:

The JCOMM OCG Chair has been working with the JCOMM Co-President Nadia Pinardi to develop a vision for an Open GTS node to enable the broader community to access GTS datastreams.

<table>

</tr>
</tbody>
</table>

7.3. Marine Climate Data System (MCDS)

The MCDS is building a system to assure the flow of delayed mode marine meteorological and oceanographic climate data to long term archives at WMO-IOC Centres for Marine meteorological and Oceanographic Climate data (CMOCs) through Data Acquisition Centres (DACs) and Global Data Assembly Centres (GDACs), including existing ones. CMOC/China has been established by Cg-17 (2015), and it is foreseen to also establish the International Comprehensive Ocean- Atmosphere Data-Set (ICOADS of USA) as a CMOC. CMOCs will make their historical records discoverable and visible through the WMO Information System (WIS).
7.4. **Strengthen links with the satellite community,**

We have a tendency to think about Satellite observations separately from the in situ observing system and there is a strong need to consider satellites as an integrated component of the observing system for the benefit of both, especially:

- For *in situ* validation of EOVs/ECVs,
- In anticipation of new satellite mission capabilities and potential for complementary in situ observations to ensure we exploit observations to the full (e.g. resolving diurnal cycle, mesoscale variability, new salinity missions), and
- for integrated product development.

7.5. **Ensure data streams have homes and support for data management.**

The management of ocean data has mainly developed through platform based observing programmes; while many data-streams are well managed, some data-streams, particularly delayed mode data, does not have a home within a data centre. JCOMM OCG needs to identify the critical data-streams without a home, and work with the data centres to seek adequate curation of these data-streams.

8. **JCOMMOPS**

JCOMMOPS provides technical coordination to many of the JCOMM OCG networks. Recently the JCOMMOPS secretariat has transitioned from Toulouse to Brest, and has established a consolidated secretariat. JCOMMOPS gets guidance from a number of groups; the networks they serve (and each serve more than one), OCG chairs, and the secretariat.

8.1. **Strengthen the planning, guidance and oversight of JCOMMOPS activities.**

It was decided that a structure for JCOMMOPS oversight is required, and a JCOMMOPS roundtable has been formed, comprising the network chairs, the OCG chairs, JCOMMOPS and the secretariat. This mechanism is design to be a management board, providing oversight to JCOMMOPS through quarterly telecons.

2016 Update:

**Much of the discussion at the OCG meeting was focused on the development of the JCOMMOPS webtool, and feedback from the OCG members.**

<table>
<thead>
<tr>
<th>ACTION</th>
<th>JCOMMOPS web tool needs an easier-to-find front page description/introduction to JCOMMOPS (JCOMMOPS)</th>
</tr>
</thead>
<tbody>
<tr>
<td>35</td>
<td>JCOMMOPS, Secretariat to solicit representatives from networks</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>ACTION</th>
<th>Develop and distribute a regular update on status of the JCOMM observing system by the start of 2017:</th>
</tr>
</thead>
</table>
8.2. **Encourage JCOMMOPS to continue its outreach to new platform groups, such as the glider community.**

We are beginning to see the broader benefits of bringing the technical coordination of observing networks under one roof within JCOMMOPS, building and capitalizing on the synergies across the observing networks.

**2016 Update.**

Discussions underway to include GLOSS Metadata in JCOMMOPS web tool (see GLOSS action). Discussions also underway with Gliders, HF Radar community re. the potential for a coastal technical coordinator position.

8.3. **Seek to assure the growth and continuity of the JCOMMOPS service, and its relationship with the NOAA OSMC.**

As the JCOMMOPS activity grows, we need to ensure that effective planning and oversight is in place to ensure the observing community gets maximum benefit from this coordination research, and also the JCOMMOPS team have clarity on their work plan and priorities going forward. In addition, we need to ensure effective coordination and communication between JCOMMOPS and OSMC, and ensure there is a clear separation/hand off of activities.

To foster communication across JCOMMOPS partners and to assist the smooth running of JCOMMOPS, financial and administrative support should be considered as part of the JCOMMOPS ‘common infrastructure.

**2016 Update:**

JCOMMOPS staff compliment has grown to include 3 full time technical coordinators, a admin/communications staff, plus IT staff. This has led to a step change in the capability at JCOMMOPS, and in particular allows staff to work across network areas, and common infrastructure to be developed, including centralized administrative support.

38 **ACTION:** Networks to decide whether they want network brochures in consultation with JCOMMOPS, and as appropriate, develop brochures for distribution.
9. **Priorities and timeline of activities.**

**2016:** GCOS IP (OOPC Lead: drawing on Variable and Network Specifications),
Finalise Network Specifications

**2017:** JCOMM-5 Initial input (March)
Possible workshop: Boundary Currents?
WCRP Conference on Sea Level,
**JCOMM-5, (November)**
Initial Outcomes: TPOS 2020 Backbone TT (TP Design),

2018

2019: OceanObs19 (Sept)

META-T | Water Temperature instrument/platform Metadata Pilot Project (JCOMM)
METOP | Meteorological Operational satellites of the EUMETSAT Polar System (EPS)
MOFS | Met-Ocean Forecasts and Services
MOI | Mauritius Oceanography Institute
MOU | Memorandum of Understanding
MSC | Meteorological Services of Canada
NAVOCEANO | Naval Oceanographic Office (USA)
NC | National Centres (WMO WIS)
NCDC | NOAA National Climatic Data Center (USA)
NCEP | NOAA National Center for Environmental Prediction (USA)
NCOSM | National Centre of Ocean Standards and Metrology (China)
NDBC | NOAA National Data Buoy Center (USA)
NESDIS | NOAA National Environmental Satellite Data and Information Service (USA)
NFP | National Focal Point
NIOT | National Institute of Ocean Technology (India)
NMDIS | National Marine Data and Information Service (China)
NMHS | National Meteorological and Hydrological Service
NOAA | National Oceanic and Atmospheric Administration (USA)
NODC | National Oceanographic Data Centre
NPDBAP  DBCP-PICES North Pacific Data Buoy Advisory Panel
NPOESS  National Polar-orbiting Operational Environmental Satellite System (USA)
NSF    National Science Foundation (USA)
NWP    Numerical Weather Prediction
NWS    NOAA National Weather Service (USA)
OceanSITES  OCEAN Sustained Interdisciplinary Timeseries Environment Observation System
OCG    Observations Coordination Group (JCOMM)
OCO    NOAA Office of Climate Observation (USA)
ODAS   Ocean Data Acquisition Systems
ODASMS  ODAS Metadata Service (operated by China on behalf of JCOMM)
ODINAFRICA  Ocean Data and Information Network for Africa (IODE)
ODP    Ocean Data Portal (IODE)
ODT    Observation Development Team
OGP    Oil and Gas Producers
OOPC   Ocean Observations Panel for Climate (GCOS-GOOS-WCRP)
OPA    Observations Programme Area (JCOMM)
OPAG   Open Programme Area Group
OPAG-IOS  CBS OPAG on the Integrated Global Observing System
OPSC   Observing Programme Support Centre
OPSCOM  Argos Operations Committee
OSE    Observing System Experiment
OSMC   NOAA Observing System Monitoring Center (USA)
PA     Programme Area (JCOMM)
PANGEA Partnerships for New GEOSS Applications
PGC    Principal GTS Co-ordinator (DBCP)
PICES  North Pacific Marine Science Organization
PICO   Panel for Integrated Coastal Observations
PIRATA  Pilot Research Moored Array in the Tropical Atlantic
PMEL   NOAA Pacific Marine Environmental Laboratory (USA)
PMO    Port Meteorological Officer
PMOC   Principal Meteorological or Oceanographic Centres responsible for quality control of buoy data (DBCP)
PMT    Platform Messaging Transceivers
POGO   Partnership for Observation of the Global Oceans
PP-WMD  Pilot Project on Wave Measurement from Drifters
PP-WET  JCOMM Pilot Project on Wave Measurement Evaluation and Test from moored buoys
PTT    Platform Transmitter Terminal (Argos)
QA     Quality Assurance
QC     Quality Control
QMF    WMO Quality Management Framework
QMS    Quality Management Systems
RAMA   Indian Ocean Research Moored Array for African-Asian-Australian Monsoon Analysis and Prediction
RMIC   WMO-IOC Regional Marine Instrument Centre
RMS    Root Mean Square
RNODC  Responsible Oceanographic Data Centre (IODE)
RNODC/DB RNODC for Drifting Buoys
RRR    Rolling Review of Requirements
RTMC   VOSClim Real-Time Monitoring Centre
RUDICS Iridium Router-Based Unrestricted Digital Interworking Connectivity Solution
RV     Research Vessel
SADC South African Development Community
SAMS Scottish Association for Marine Science
SAT Site Acceptance Test
SAWS South African Weather Service
SBD Short Burst Data (Iridium)
SC Steering Committee
SCAR Scientific Committee on Antarctic Research
SCG Services Coordination Group (JCOMM)
SeaDataNET Pan-European infrastructure for Ocean & Marine Data Management
SFSPA JCOMM Services and Forecasting Systems Programme Area
SIA Seasonal to Inter-Annual Forecast
SIO Scripps Institution of Oceanography (University of California, USA)
SLP Sea Level Pressure
SMOS Soil Moisture and Ocean Salinity mission
SOBP Southern Ocean Buoy Programme
SOC Specialized Oceanographic Centre (JCOMM)
SoG Statements of Guidance
SOOP Ship-Of-Opportunity Programme
SOOPIP SOOP Implementation Panel (JCOMM)
SOT Ship Observations Team (JCOMM)
SPA JCOMM Services Programme Area (now SFSPA)
SSA WMO Special Service Agreement
SSG Scientific Steering Group
SST Sea-Surface Temperature
STIP Stored Tiros Information Processing
SVP Surface Velocity Programme (of TOGA and WOCE, replaced by GDP) drifter
SVP-B SVP barometer drifter
SVP-BS SVP drifter with salinity
SVP-BTC SVP drifter with temperatures in depth
SVP-BW SVP barometer and wind at a drifter
TAO Tropical Atmosphere Ocean Array
TC Technical Co-ordinator
TD Technical Document
TIP Tiros Information Processing
TIP Tropical Moored Buoys Implementation Panel
TOGA Tropical Atmosphere and Global Ocean programme
TOWS-WG Working Group on Tsunamis and Other Hazards Related to Sea-Level Warning and Mitigation Systems
TRITON Triangle Trans-Ocean buoy network
TT Task Team
TT-CB DBCP Task Team on Capacity-Building
TT-DM DBCP Task Team on Data Management
TT-MB DBCP Task Team on Moored Buoys
TT-IBP DBCP Task Team on Instrument Best Practices & Drifter Technology Developments (merged the TT-QM & TT-TD)
TT-QM DBCP Task Team on Quality Management (now merged into TT-IBPD)
TT-TD DBCP Task Team on Technological Development (now merged into TT-IBPD)
TT-TDC DMPA Task Team on Table Driven Codes
UN United Nations
UNESCO UN Educational, Scientific and Cultural Organization
UNFCCC United Nations Framework Convention on Climate Change
